General sentiment on A.I. in construction

“One of the greatest challenges in construction management is how a single error can snowball into significant losses in terms of time, money, and other risk elements. This technology can ultimately be very useful in construction management if the output is validated by someone who knows.”

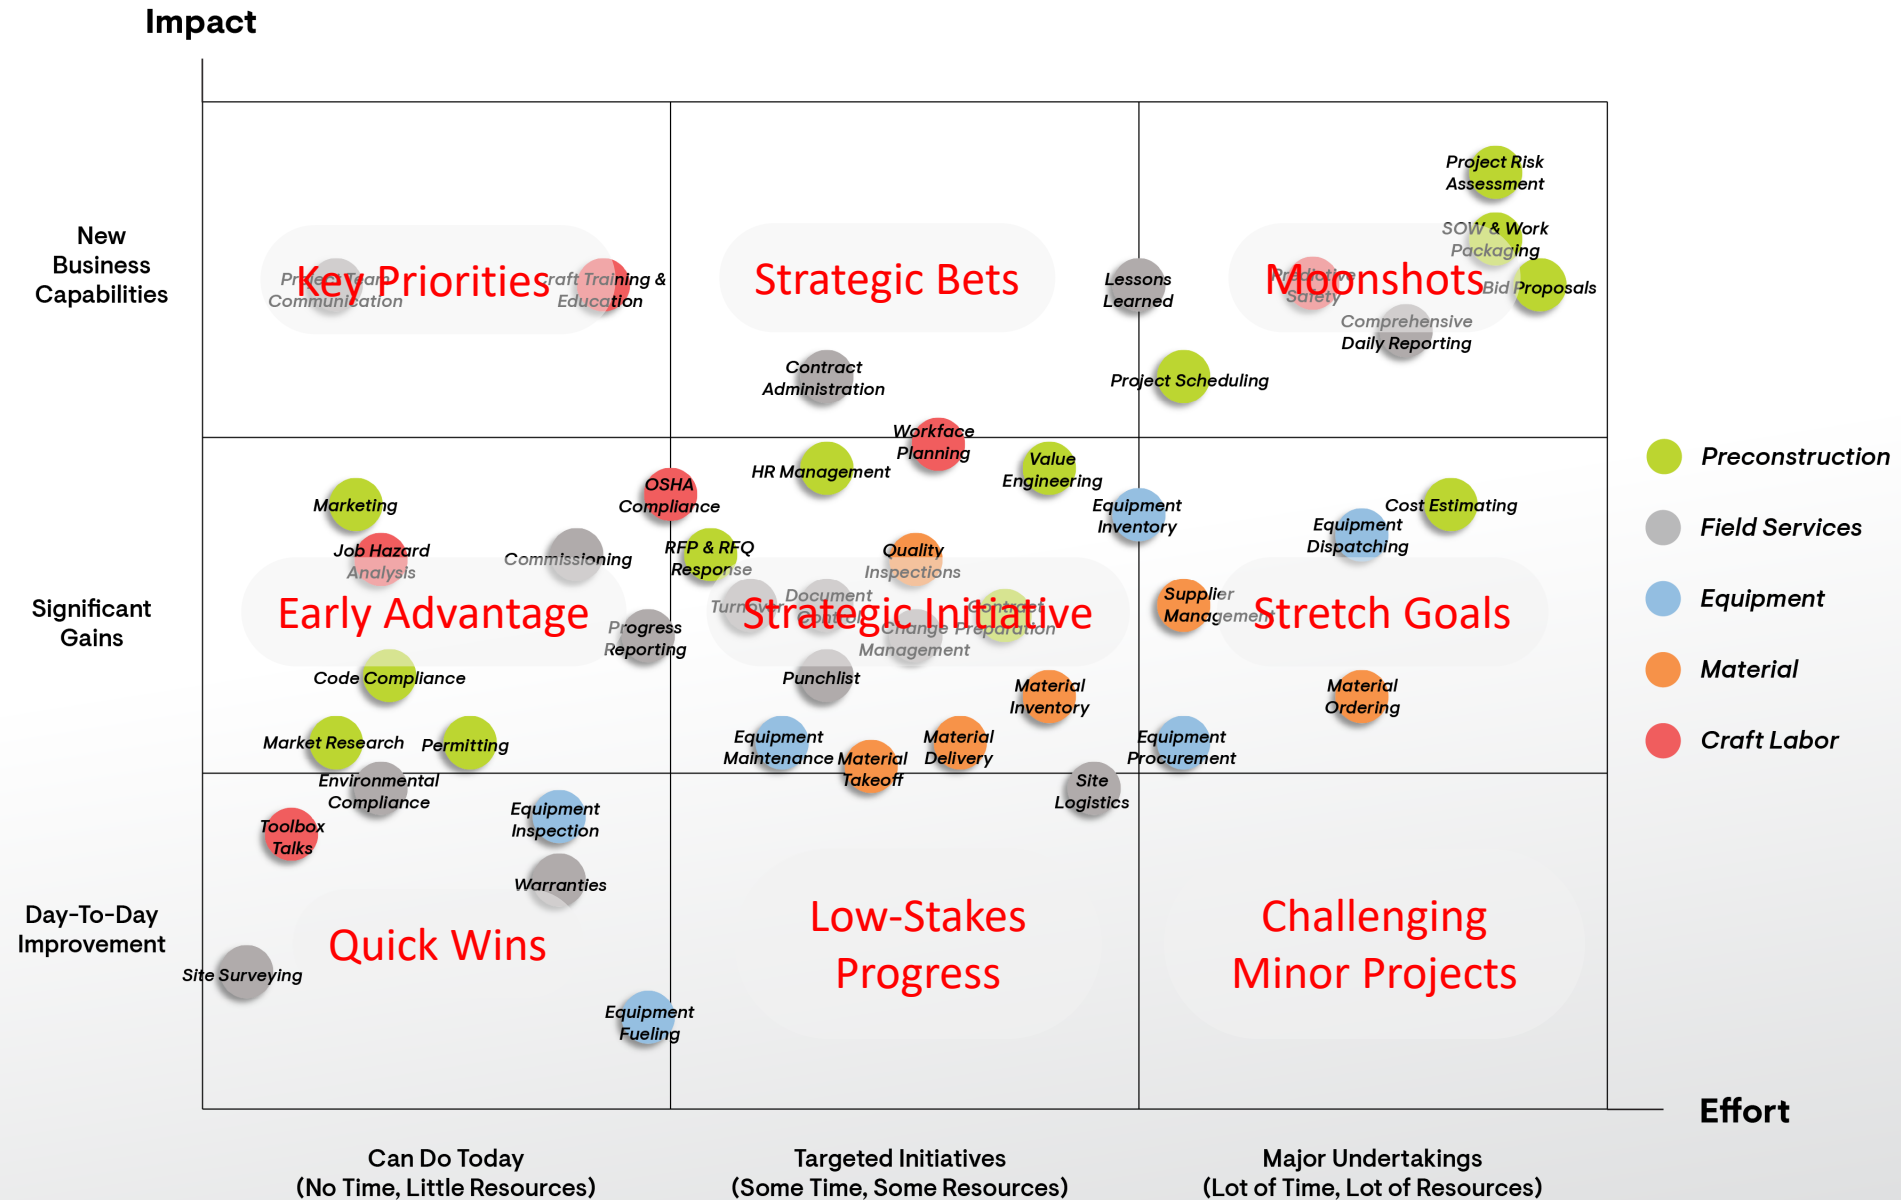

Heather Pettijohn
Lean Evolution Manager at Barton
Malow

“Our policy change mirrors our social media guidelines. It doesn’t allow the release of company, client, or trade secret information. When using consumer products like ChatGPT, we assume that the information is now in the public domain.”

Mark Trednick
CIO at Haskell

Six challenges in A.I. adoption:

- Business Alignment – back office-to-field divide
- Technical Considerations – high proportion of “shadow IT” in construction
- Data Management – unstructured data and siloed processes
- Security Considerations – critical infrastructure projects in construction
- Organizational Factors – change management in a traditional industry
- Financial Considerations – investment horizon

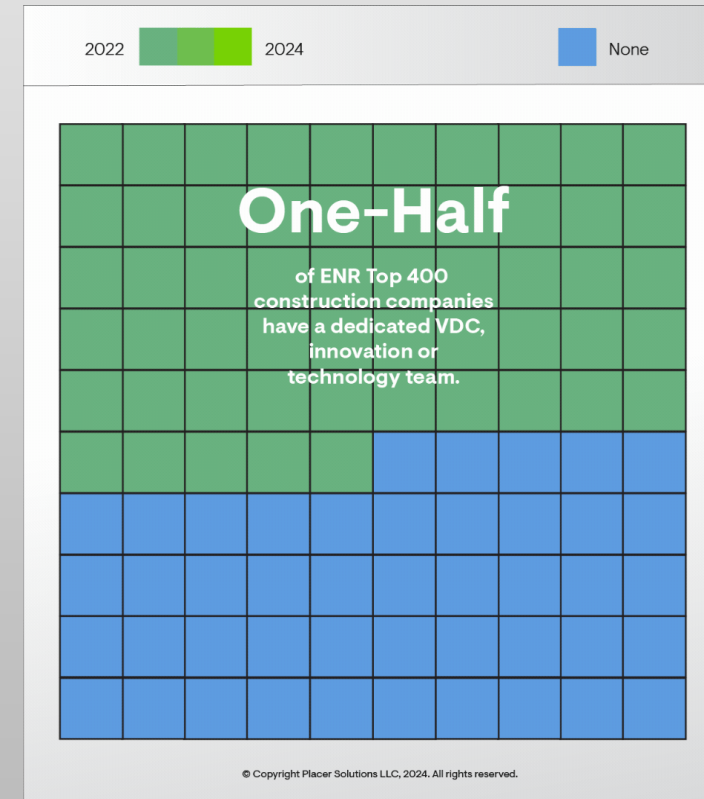

AGC
THE CONSTRUCTION
ASSOCIATION

Construction is increasingly accepting A.I. and emerging technology.

Concepts like generative A.I. that were foreign to the industry 10 years ago are making their way into executive-level conversations.

This is driven by a profound transformation happening in our industry, fueled by the rapid adoption of technologies like ChatGPT and a slow-moving functional shift towards dedicated operational technology departments like VDC.

AGC
THE CONSTRUCTION
ASSOCIATION

Half of respondents have dedicated emerging technology resources.

The average reported annual budget is around \$200-300K, which indicates a small team of one or two. This aligns with industry surveys done by Placer Solutions.

Several respondents said things like: *"Nothing is dedicated, but everyone on the staff knows we will look at anything they may find."*

Virtual Design &
Construction Department

Construction Technology
Department

Innovation Department

Construction technology departments pushing A.I. forward.

The fragmented emerging technology departments in construction reflect our fragmented industry. General building contractors accustomed to using BIM are driving A.I. initiatives through Virtual Design & Construction, others are leaning into Construction Technology or Innovation Departments.

Respondents claim a high degree of receptiveness in their organization.

A significant part of A.I. readiness involves organizational change and helping employees understand risks associated with the A.I. tools that are available. The benchmark examines areas like learning and development, communication of changes, and champion networks.

IT Operations &
Maintenance Team

IT Infrastructure Team

Data Management
Team

IT departments are evolving to address A.I. implementation.

Construction companies are beginning to include data management as part of their IT teams. These teams are responsible for consolidating fragmented data systems, addressing unique security threats, ensuring data integrity and accessibility, and providing ongoing support and training to staff to maximize the benefits of A.I. technologies.

THE CONSTRUCTION
ASSOCIATION

Most respondents have a change strategy to achieve business goals.

Although not always documented, having a change strategy in place to achieve A.I. business goals is a first step. Best practices involve creating A.I. committees or cross-functional teams who can help with business alignment.

Moderate investment timeframes are the norm in construction.

Many respondents say that their technology investment timeframe is on a moderate timeline of 2-4 years while about one-quarter expect immediate or short-term ROI.

Mostly to
predominately
internal

Sourcing external solutions is the preferred method of A.I. adoption, although there's a mix.

The vast majority of construction companies say that they “predominately” source external solutions (more than 90%). However, larger companies among our respondents indicate that they are also building and experimenting with internal solutions for their businesses.

Construction companies are balancing centralized specification with project level decision-making.

The construction industry is unique with its project and field-based project delivery method. A.I. presents an amazing opportunity to accelerate citizen development with no or low-code solutions.

Measured A.I. Policy

Haskell implemented a robust policy that emphasizes information security and public awareness, coupled with educational measures for employees. Parallel to policy updates, Haskell is fostering innovation by encouraging A.I. exploration in engineering design and establishing an A.I. Coordination Group for strategic discussions on A.I. implementation across departments.

“This is something that is not going to go away. It is big enough that we need to pay attention to it.”

— Mark Trednick, Haskell CIO

Best Practices for Construction

The construction industry is exploring the potential of text-based A.I. like GPT-4, but adoption requires careful planning at individual, organizational, and industry levels. Early preparation and responsible governance are key to leveraging A.I. as a strategic advantage in construction.

Individual

Think of text-based A.I. as a **tool that augments human expertise**, not replaces it. While text-based A.I. can automate mundane tasks, the output still requires **human validation**.

Knowledge workers → “knowledgeable” workers

Firm

Outline clear protocols for acceptable use, and keep your team updated through **educational initiatives**. Investing in expert support to set up secure, customized **internal applications** can be a game-changer.

Industry

Sharing key insights and practices can fast-track the industry's digital transformation. Moreover, text-based A.I. has the capacity to be a catalyst for **workforce development**.
